Abstracts

Rapid melting silicon is a silicon material prepared by high-temperature melting and rapid cooling, with an amorphous structure. This structure results in a lower density of fast melting silicon, corresponding to lower hardness and strength. In addition, fast melting silicon is unstable at high temperatures and prone to decomposition. It is also unstable at room temperature and is easily oxidized by oxygen and water vapor in the air. Therefore, its chemical activity is high and it can react with many substances.

The global Fast Melting Silicon market size was estimated at USD 183.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
