### Report Overview:

A fast recovery diode is a semiconductor-based PN junction diode that has a very fast reverse recovery time. It is also known as a fast diode or fast switching diode. Since it has a very fast reverse recovery time as compared to a conventional diode, it is best suited for high-frequency applications.

The diode conducts current in forward bias and blocks current in reverse bias. But due to the stored charge in its junction, it is unable to immediately block current when the applied voltage changes from forward to reverse bias. Due to stored charge carriers, it conducts in the reverse direction for a short duration of time called reverse recovery time.

A conventional diode has a large reverse recovery time and it is unable to block a high-frequency signal as the reverse half cycle conducts during the reverse recovery time. Therefore, the fast recovery diode is used for rectification of high-frequency signals.

The Global Fast Recovery Diodes Market Size was estimated at USD 880.05 million in 2023 and is projected to reach USD 1646.05 million by 2029, exhibiting a CAGR of 11.00% during the forecast period.
