Abstracts

Fat cavitation machines are non-invasive aesthetic devices that use low-frequency ultrasound technology to target and disrupt adipose tissue, primarily for body contouring and localized fat reduction purposes; these machines operate by emitting ultrasonic waves that cause fat cells to emulsify and rupture, after which the liquefied fat is metabolized and eliminated naturally by the body's lymphatic system, making them a popular alternative to surgical liposuction due to their minimal downtime, reduced risk, and ability to treat areas such as the abdomen, thighs, and arms without incisions or anesthesia.

The global Fat Cavitation Machine market size was estimated at USD 682.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
