## Abstracts

FC-CSP is a chip-scale package form, and according to the J-STD-012 standard, the package size does not exceed 1.2 times that of the bare chip. It achieves electrical interconnection through flip-chip bonding of bumps to the substrate, with the chip face down directly bonded to the substrate. Compared to traditional wire bonding (WB) and tape-on-board (TAB) packaging, it offers shorter signal paths and higher I/O density, making it particularly suitable for large-scale integrated circuits (LSI), very large-scale integrated circuits (VLSI), and application-specific integrated circuits (ASICs). Typical applications include smartphone processors, server memory modules, and high-density RF chips. Its core advantages lie in miniaturization, low power consumption, and high-performance integration.

The global FC-CSP market size was estimated at USD 469.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global FC-CSP market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
