Report Overview

Fc fusion protein is composed of the Fc segment of immunoglobulin and protein molecules with biological activity. The Fc segment and the functional protein have relatively independent structural domains and functions, which can affect the physical and chemical properties and biological activities of the fusion protein from different angles.

Fc-fusion proteins are bioengineered polypeptides that join the crystallizable fragment (Fc) domain of an antibody with another biologically active protein domain or peptide to generate a molecule with unique structure–function properties and significant therapeutic potential. The gamma immunoglobulin (IgG) isotype is often used as the basis for generating Fc-fusion proteins

This report will focus on Fc fusion protein drugs.
