Abstracts

Fused Deposition Modeling (FDM) and Stereolithography (SLA) 3D printers represent two distinct additive manufacturing technologies catering to different market segments and applications. FDM printers, which operate by extruding thermoplastic filaments layer by layer, are widely recognized for their affordability, ease of use, and suitability for functional prototyping, educational purposes, and hobbyist projects, with materials like PLA and ABS being commonly used. In contrast, SLA printers utilize a laser or light source to cure liquid resin into solid objects, delivering higher resolution, smoother surface finishes, and greater precision, making them ideal for applications requiring fine details, such as dental models, jewelry, and high-accuracy prototypes, albeit often at a higher cost and with more post-processing requirements. The market for these technologies is driven by factors including declining hardware prices, advancements in material science, expanding adoption across industries like healthcare, automotive, and aerospace, and the growing DIY and maker communities, though it also faces challenges related to material limitations, speed constraints, and competition from other emerging 3D printing methods.

The global Fdm And Sla 3D Printers market size was estimated at USD 2925.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 21.50% during the forecast period.
