Report Overview

In a fecal immunochemical diagnostic test, antibodies are used to detect blood in the stool, which bind to a blood protein called hemoglobin found in red blood cells (RBC). A positive result of a fecal immunochemical diagnostic test may be a sign of colorectal cancer, polyps, ulcers or hemorrhoids. Blood vessels are usually very fragile and therefore easily damaged. The passage of stool can cause bleeding. If the fecal immunochemical diagnostic test results are positive, further colonoscopy is required for further research.

The global Fecal Immunochemical Diagnostic Tests market size was estimated at USD 1780.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
