Abstracts

Feed anticaking agents are chemical substances added to animal feed to prevent the formation of lumps and ensure free-flowing properties, thereby maintaining consistency, improving handling, and preserving nutritional quality during storage and transportation. These agents work by absorbing excess moisture or coating feed particles to reduce cohesion, with common types including sodium aluminosilicate, calcium silicate, magnesium stearate, and certain clays. Their use is essential across various livestock and poultry feed formulations to prevent caking caused by humidity, temperature changes, or ingredient composition, ensuring both operational efficiency in feed production and optimal animal intake.

The global Feed Anticaking Agents market size was estimated at USD 280.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.45% during the forecast period.
