Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Feed Grade Potassium Carbonate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Potassium carbonate plays multiple important roles in the feed industry. Adding an appropriate amount of potassium carbonate can effectively improve the nutritional value of feed. Potassium carbonate can promote the fermentation of feed and reduce the pH value of feed, making plant protein more easily absorbed and utilized by livestock, thereby improving the overall nutritional value of feed. Potassium carbonate helps promote the healthy growth of animals. It can lower the pH value of the gastrointestinal tract in livestock, enhance their digestion and absorption capacity, and help to better utilize nutrients. In addition, potassium carbonate can regulate the electrolyte balance in livestock, maintain acid-base balance, enhance immunity, and reduce the risk of diseases in livestock. The addition of potassium carbonate also helps to improve agricultural production efficiency. By promoting the fermentation of feed, reducing feed costs, improving feed utilization and production performance, potassium carbonate can help increase the yield of beef and dairy cattle, improve animal breeds, and thus enhance overall agricultural production efficiency. In 2024, global Feed Grade Potassium Carbonate production reached approximately 85872 Tons, with an average global market price of around US\$ 1083 per ton. For modern continuous production equipment using ion exchange or electrolysis methods, the annual production capacity of a single production line is about 500 tons. Upstream: mainly suppliers of basic chemical raw materials, with the core being potassium chloride and carbon dioxide, and the cost is greatly affected by international price fluctuations of potassium fertilizer (potassium chloride). Midstream: Potassium carbonate producers with high technical barriers (especially food/feed grade purification processes) and high market

concentration. Downstream: The application field is highly concentrated, mainly used as feed additives (providing potassium elements, anti caking agents, acidity regulators), followed by the food industry, high-end chemicals, etc.

The global Feed Grade Potassium Carbonate market size was estimated at USD 93.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
