Abstracts

Feed palatability enhancers are specialized ingredients or additives incorporated into animal feed formulations to improve the taste, aroma, texture, and overall sensory appeal of feed, thereby encouraging higher voluntary intake, reducing feed refusal, and supporting optimal animal health and growth performance. These enhancers work by masking undesirable flavors from certain raw materials, medications, or byproducts, or by amplifying naturally appealing tastes through the use of flavors, sweeteners, acidifiers, or natural extracts. They play a critical role in maximizing nutrient utilization, minimizing waste, and ensuring consistent consumption across various livestock, poultry, aquaculture, and pet food segments, particularly in scenarios where feed quality, health stressors, or ingredient variability might otherwise suppress appetite.

The global Feed Palatability Enhancers market size was estimated at USD 1350.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
