Abstracts

The Feeder Remote Terminal Unit (FRTU) is a specialized industrial automation device deployed in electrical distribution networks to monitor, control, and protect feeder lines—the circuits that distribute power from substations to end-users. Functioning as a critical component of supervisory control and data acquisition (SCADA) systems, FRTUs gather real-time data on parameters such as voltage, current, power flow, and fault conditions, enabling utilities to automate operations like load switching, fault isolation, and service restoration. These units support communication protocols such as IEC 60870-5, DNP3, and Modbus, and often integrate with smart grid technologies to enhance grid reliability, reduce outage durations, and improve energy efficiency. Their role is essential in modernizing distribution infrastructure, supporting distributed energy resources (DERs), and advancing toward more resilient and self-healing grid architectures.

The global Feeder Remote Terminal Unit market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
