Abstracts

Feed-through connectors are connectors used in electrical and electronic devices, primarily for transferring signals, currents, or voltages from one enclosed space to another. They are typically installed through a device housing or a partition wall, allowing electrical connections to penetrate the outer boundaries of the device without affecting the sealing of the external environment. Through-the-wall connectors are widely used in equipment that requires sealing and isolation, such as cabinets, sensors, medical instruments, communication equipment, etc., and can effectively prevent external contaminants from entering the interior of the device while ensuring reliable electrical signal transmission.

The global Feedthrough Connectors market size was estimated at USD 3746.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
