Abstracts

Femoral components refer to orthopedic implants used in total hip replacement surgeries to replace the damaged or diseased parts of the femur (thigh bone) and restore normal hip joint function and mobility. These components are typically made of biocompatible materials, such as metal alloys, ceramic materials, or high-grade polyethylene, and are designed to provide structural support, stability, and articulation capabilities in the hip joint, enabling patients to regain joint functionality, alleviate pain, and improve overall hip joint movement and range of motion following hip replacement surgery. The market was witnessing advancements in implant materials, surface coatings, and biocompatible alloys, fostering the development of durable, wear-resistant, and bioactive femoral components with enhanced osseointegration properties and improved long-term implant fixation, as orthopedic manufacturers and researchers focused on material science innovations, surface engineering techniques, and biocompatibility enhancements to optimize implant performance and patient outcomes in total hip arthroplasty and hip joint reconstruction procedures.

The global Femoral Components market size was estimated at USD 3620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
