Abstracts

The femoral head prosthesis is a critical orthopedic implant designed to replace the damaged or deteriorated femoral head—the ball at the top of the thigh bone—typically due to conditions like osteoarthritis, avascular necrosis, or traumatic fractures, with the primary objective of restoring hip joint function, alleviating pain, and improving mobility. These prostheses are commonly part of total hip arthroplasty (THA) systems and are engineered from biocompatible materials such as cobalt-chromium alloys, ceramic, or highly cross-linked polyethylene, often featuring modular components that allow customization based on patient anatomy and surgical requirements. Key design considerations include wear resistance, stability, and compatibility with the acetabular component to minimize long-term complications like dislocation, osteolysis, or implant loosening, while advancements in materials science and manufacturing techniques continue to enhance durability and biocompatibility.

The global Femoral Head Prostheses market size was estimated at USD 1320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
