Abstracts

In the past 20 years, refractive surgery technology has experienced rapid development and innovation. One of the most innovative technologies is femtosecond laser, which provides the possibility of minimally invasive treatment in the field of refractive surgery. Femtosecond lasers use near-infrared pulses to cut through tissue, reducing damage to adjacent tissue. The low energy and precise targeting and focusing of femtosecond laser will make this technology have great application prospects and development potential in the near future, and it will be used for three-dimensional micron ablation in the corneal stroma. At present, the role of femtosecond laser has been proven in many fields, such as corneal lamellar transplantation, replacement of trephine in penetrating keratoplasty, fabrication of corneal stromal ring tunnel, quality of astigmatism in transplanted cornea, non-invasive in glaucoma surgery Establishment of sexual scleral channel, retinal imaging hyperopia surgery and cataract surgery. The improvement of laser speed will further improve the safety and effectiveness of surgery, reduce the operation time, and expand the application scope of femtosecond laser in ophthalmology.

The global Femtosecond Laser System For Ophthalmic Surgery market size was estimated at USD 1250.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
