Abstracts

Ferro chromium powder is an alloy of iron and chromium, produced by reducing chromite ore with carbon in an electric arc furnace and then milled into a fine powder. It typically contains between 50% and 70% chromium. This powder is primarily used as an alloying agent in the production of stainless steel and other high-temperature alloys. It enhances the steel's corrosion resistance, hardness, and strength. The powder form allows for precise control over the chromium content in the final alloy, making it essential for achieving specific material properties in various industrial applications. The ferro chromium powder industry is driven by the global demand for stainless steel. Upstream, there's a focus on sustainable production methods and reducing carbon emissions. Downstream, the automotive, construction, and consumer goods sectors are key consumers. Product specifications are increasingly demanding finer particle sizes, higher purity, and consistent chemical compositions for specialized applications. The future market size is expected to grow, driven by increasing infrastructure development and the demand for corrosion-resistant materials. The trend is towards more environmentally friendly production and tailored powder characteristics to meet the evolving needs of advanced industries.

The global Ferro Chromium Powder market size was estimated at USD 173.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
