Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ferrosilicon Inoculant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Ferrosilicon inoculant is an alloying additive used in cast iron production, composed of silicon and iron. Its main function is to promote graphite precipitation and reduce carbide formation during the solidification process of cast iron, thereby improving the strength, toughness, machinability, and microstructure uniformity of the castings. The upstream sector supplies basic raw materials, primarily ferrosilicon. Downstream applications are concentrated in the casting industry, mainly for the production of gray cast iron and ductile iron. Global sales volume in 2024 was approximately 530,000 tons, with an average market price of approximately US\$1,000 per ton. The size of a single production line varies depending on the production process and investment scale. Industry gross profit margins range from 15% to 30%.

The global Ferrosilicon Inoculant market size was estimated at USD 530.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
