Abstracts

Ferrous sulfate chelate is a specialized form of iron supplement in which ferrous sulfate—a common inorganic iron salt—is chemically bound to an organic chelating agent, such as amino acids (e.g., glycine) or other ligands, to form a stable, soluble complex that enhances iron absorption in the human body while minimizing gastrointestinal side effects and reducing interactions with dietary inhibitors like phytates and tannins. This chelation process improves bioavailability compared to non-chelated iron forms, making it particularly valuable in nutritional supplements, fortified foods, and animal feed additives where efficient iron delivery is essential for addressing deficiencies such as anemia.

The global Ferrous Sulfate Chelate market size was estimated at USD 220.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
