Abstracts

Fertility medicines Infertility continues to pose a global health challenge due to demographic changes and ongoing lifestyle issues, including obesity, anxiety, stress and other factors that lead to delayed childbearing. For example, according to alcoholic beverage consumption statistics released in February 2023, approximately 63% of adults aged 18 and older in the United States drank alcohol between 2021 and 2022. Additionally, 12.5% of adults in the UK reported teetotaling, while the drinking rate among adults in the country was 71.2% (drinking at least once a week), according to data released by UK Alcohol Consumption Statistics in February 2023. Therefore, heavy drinking can affect fertility in both men and women. In turn, it is expected to boost demand for infertility drugs over the forecast period. The low fertility rate prevalent among the population is also a key factor driving the market growth. For example, in July 2022, about 15% of U.S. couples and at least 180 million people worldwide were suffering from infertility, according to an article published by the U.S. National Library of Medicine.

The global Fertility Medicines market size was estimated at USD 5133.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
