Report Overview

Fetal monitoring refers to electronic patient monitoring. It records the vital physiological functions of the fetus and the contractions of the mother's uterus during pregnancy and birth. Fetal monitors are bedside units that include an observing monitoring unit, cables, and electrodes. They measure, record, and display FHR, uterine contractions, and maternal BP and heart rate before and during labor. Fetal monitors detect the FHR and uterine contraction indirectly through the mother's stomach. This can be done either through external fetal monitoring or internal fetal monitoring, which involves the placement of an electrode on the fetal scalp (or other exposed skin surface) to measure the changes in pressure inside the uterus.
