Abstracts

Fexofenadine hydrochloride is a second-generation, non-sedating antihistamine used primarily for the relief of symptoms associated with seasonal allergic rhinitis and chronic idiopathic urticaria (hives). It functions as a selective peripheral H1-receptor antagonist, effectively reducing allergic responses without crossing the blood-brain barrier to a significant degree, thereby minimizing drowsiness and central nervous system side effects commonly associated with first-generation antihistamines. Marketed under various brand names globally, such as Allegra in the United States and Telfast in other regions, it is available in multiple formulations including tablets, orally disintegrating tablets, and oral suspensions, catering to diverse patient demographics from adults to pediatric populations. As a prescription-to-over-the-counter (OTC) transition product in many markets, its accessibility has expanded significantly, making it a widely utilized option for allergy management.

The global Fexofenadine Hydrochloride market size was estimated at USD 1250.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
