Report Overview

The fiber-coupled laser is an industrial machine, the minimum spot diameter is $\geq 0.3\text{mm}$, the spot size can be adjusted according to the use distance, the exit pupil power is $0.3\text{mW}\sim 50\text{mW}$, the divergence angle is $0.1\text{mrad}\sim 0.6\text{mrad}$, and the fiber core diameter is between $9\mu\text{m}$ and $200\mu\text{m}$ between. The working principle of a fiber-coupled laser is to 'couple' the laser light emitted from a semiconductor laser into an optical fiber. Generally, if it is directly irradiated, the coupling efficiency is relatively low (about 10%) because the divergence angle of the light source is relatively large. Therefore, a lens group (cylindrical lens + self-focusing lens) is generally added between the laser and the optical fiber to focus, thereby improving the coupling efficiency, or it is also possible to perform some processing on the receiving end face of the optical fiber.

This report provides a deep insight into the global Fiber-Coupled Lasers market covering all its essential aspects. This ranges from a macro overview of the market to micro details of the market size, competitive landscape, development trend, niche market, key market drivers and challenges, SWOT analysis, value chain analysis, etc.
