Abstracts

Fiber laser modules for LiDAR are compact, integrated optical systems that generate and emit coherent light through stimulated emission within a doped optical fiber, specifically optimized for integration into Light Detection and Ranging (LiDAR) systems. These modules typically operate in the near-infrared spectrum, often at wavelengths such as 905 nm or 1550 nm, balancing eye safety regulations with atmospheric transmission and detector sensitivity. Key components include the fiber laser source itself, associated drive electronics for pulse control, thermal management systems to ensure wavelength stability, and optical elements for beam shaping and collimation. Their design prioritizes high pulse repetition rates, narrow pulse widths, and precise power output to enable accurate distance measurement, 3D mapping, and object detection in applications ranging from autonomous vehicles and robotics to topographic surveying and industrial automation.

The global Fiber Laser Module For Lidar market size was estimated at USD 285.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 19.50% during the forecast period.
