Abstracts

Fiber optic cold light source is a lighting device that transmits light through optical fiber without heat transfer between the light emitter and the illuminated object. The core component of fiber optic cold light source is the light emitter, which is commonly a light emitting diode (LED) or a metal halide lamp. These light emitters generate light through a specific electro-optical conversion mechanism. Taking LED as an example, when current passes through a semiconductor material, electrons and holes recombine, release energy and emit it in the form of photons, thereby generating light.

The global Fiber Optic Cold Light Sources market size was estimated at USD 448.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
