Report Overview

The fiber optic detector consists of a transmitter and a receiver. The light source adopts light emitting two-board tube (LED). The light beam reflected from the surface of the object is measured by the generating diode. Therefore, the distance between the detector and the object becomes a function of the illumination field of the transmitting fiber and the field of view of the receiving fiber. According to the different combination structure of reflecting and receiving fiber. The distance curve will form different basic characteristics, which can determine the nature of the measured surface.

The global Fiber Optic Detector market size was estimated at USD 400.69 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
