## Abstracts

The fiber-optic downhole monitoring system is a real-time dynamic monitoring solution for oil wells based on distributed fiber-optic sensing technology (DAS/DTS/DSS). By deploying high-temperature and high-pressure resistant fiber-optic cables, it can achieve high-precision measurement of multiple parameters such as downhole temperature, pressure, acoustic vibration, flow, etc. The system uses the principle of optical time domain reflectometry (OTDR) or Brillouin scattering to convert physical quantities into optical signal changes. It has the advantages of anti-electromagnetic interference, long-distance coverage (up to 20km), and continuous monitoring of the entire wellbore. It is suitable for scenarios such as unconventional oil and gas production, geothermal wells, and CCUS (carbon storage) monitoring.

The global Fiber Optic Downhole Monitoring System market size was estimated at USD 859.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
