Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on ?Fiber Optic Gyroscope Integrated Navigation System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Fiber Optic Gyroscope Integrated Navigation System is a high-precision navigation system, usually composed of fiber optic gyroscope inertial measurement unit (IMU), Global Navigation Satellite System (GNSS) receiver, etc. Through advanced integrated navigation algorithms, such as Kalman filtering, the information of inertial navigation and satellite navigation is deeply integrated. In the system, the fiber optic gyroscope is used to measure the angular velocity of the carrier, and the accelerometer is used to measure the linear acceleration. After compensation and calculation, information such as the position, velocity and attitude of the carrier is obtained. In an environment with good satellite signals, inertial navigation can be corrected in real time with the help of the precise position and time information provided by GNSS to eliminate cumulative errors. In areas where satellite signals are restricted or obstructed, such as urban canyons, tunnels, and underground parking lots, the system relies on the autonomous navigation capabilities of inertial components to continue providing stable and reliable navigation data, thereby achieving high-precision and highly reliable real-time positioning and navigation. It is widely applied in fields such as unmanned aerial vehicles, vehicle navigation, ship navigation, underwater robots, and high-precision measurement equipment.

The global ?Fiber Optic Gyroscope Integrated Navigation System market size was estimated at USD 334.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.60% during the forecast period.
