Report Overview

Fiber Optic Thermometer is a temperature sensing device that uses fiber optic technology to measure temperature. It consists of a fiber optic cable that is connected to a light source and a detector. The cable is made up of two types of fibers, one that is sensitive to temperature changes and the other that is not. When light is transmitted through the cable, the sensitive fiber absorbs more light than the non-sensitive fiber, which changes the intensity of the light. This change in light intensity is then converted into a temperature reading.

Upstream industry chain of Fiber Optic Thermometer includes the production of fiber optic cables, light sources, and detectors. Downstream industry chain includes the use of the thermometer in various industries such as oil and gas, chemical, and healthcare.
