Report Overview:

Fiber optics is the technology used to transmit information as pulses of light through strands of fiber made of glass or plastic over long distances.

Optical fibers are about the diameter of a strand of human hair and when bundled into a fiber-optic cable, they're capable of transmitting more data over longer distances and faster than other mediums.

Fiber optics has been used in the medical industry for years. The physical characteristics of fiber make it a natural choice for many different applications. Commonly used for illumination, flexible image bundles, light conductors, flexible light guides, laser delivery systems, and equipment interconnects, fiber optics provide a very compact, flexible conduit for light or data delivery in equipment, surgical, and instrumentation applications.

Traditional medical fiber optic applications include light therapy, x-ray imaging, ophthalmic lasers, lab and clinical diagnostics, dental hand pieces, surgical and diagnostic instrumentation, endoscopy, surgical microscopy, and a wide range of equipment and instrument illumination.

The Global Fiber Optics Market Size was estimated at USD 6360.20 million in 2023 and is projected to reach USD 9981.22 million by 2029, exhibiting a CAGR of 7.80% during the forecast period.
