Abstracts

Fiberglass chopped strands are a form of discontinuous glass fiber reinforcement composed of short, uniformly cut glass filaments that are treated with a sizing agent to enhance compatibility with polymer matrices such as thermoplastics and thermosets; these materials are primarily used to improve mechanical properties—including strength, stiffness, and dimensional stability—in composite applications across industries such as automotive, construction, electronics, and consumer goods. The market for fiberglass chopped strands is characterized by its reliance on raw material availability (e.g., silica sand, limestone), energy-intensive manufacturing processes, and demand trends in end-use sectors, with regional variations driven by industrialization, infrastructure development, and regulatory standards for lightweight, corrosion-resistant materials. Key market dynamics include competition from alternative reinforcements (e.g., carbon fiber, natural fibers), technological advancements in sizing chemistry and production efficiency, pricing volatility of raw materials and energy, and growing emphasis on sustainability and recyclability in composite materials. Geographically, Asia-Pacific dominates both production and consumption due to robust manufacturing activity and infrastructure investments, while North America and Europe focus on high-performance applications and regulatory compliance, with emerging economies showing increasing adoption in construction and transportation sectors.

The global Fiberglass Chopped Strands market size was estimated at USD 2900.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
