Report Overview

Fiberoptic phototherapy device is a medical instrument used in the treatment of various skin conditions, especially neonatal jaundice. Neonatal jaundice is a common condition in newborn babies, characterized by the yellowing of the skin and eyes due to the accumulation of bilirubin, a yellow pigment produced during the breakdown of red blood cells. Fiberoptic phototherapy devices use light therapy to treat neonatal jaundice. They emit a specific wavelength of light, usually blue or blue-green light, which helps convert the bilirubin in the baby's skin into a more water-soluble form. The water-soluble bilirubin can then be excreted from the body through urine and stool, reducing the levels of bilirubin in the bloodstream and alleviating the symptoms of jaundice.

The global Fiberoptic Phototherapy Device market size was estimated at USD 217 million in 2023 and is projected to reach USD 328.08 million by 2032, exhibiting a CAGR of 4.70% during the forecast period.

North America Fiberoptic Phototherapy Device market size was estimated at USD 61.19 million in 2023, at a CAGR of 4.03% during the forecast period of 2024 through 2032.
