Report Overview

Fiberoptic phototherapy device is a medical instrument used in the treatment of various skin conditions, especially neonatal jaundice. Neonatal jaundice is a common condition in newborn babies, characterized by the yellowing of the skin and eyes due to the accumulation of bilirubin, a yellow pigment produced during the breakdown of red blood cells. Fiberoptic phototherapy devices use light therapy to treat neonatal jaundice. They emit a specific wavelength of light, usually blue or blue-green light, which helps convert the bilirubin in the baby's skin into a more water-soluble form. The water-soluble bilirubin can then be excreted from the body through urine and stool, reducing the levels of bilirubin in the bloodstream and alleviating the symptoms of jaundice.
