Abstracts

The Fibre-optic Hydrophone System is an underwater acoustic detection device based on fiber-optic sensing technology. The system leverages the high sensitivity and electromagnetic interference resistance of optical fibers to precisely capture sound signals in underwater environments. Its working principle mainly involves detecting changes in the intensity or phase of light signals transmitted through the optical fiber in response to underwater sound waves, which are then converted into electrical signals for processing. The fibre-optic hydrophone offers high immunity to interference, a wide operational frequency range, and good spatial resolution, making it widely applicable in marine exploration, underwater communication, military detection, and environmental monitoring.

The global Fibre-optic Hydrophone System market size was estimated at USD 54.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
