Abstracts

A fibre optic polishing system refers to a set of specialized equipment, materials, and processes used to prepare the end faces of optical fibers and connectors to achieve ultra-smooth, defect-free surfaces essential for efficient light transmission with minimal signal loss. These systems typically include polishing machines with precise pressure and motion control, consumables such as polishing films or lapping sheets with varying grit sizes, and alignment fixtures to hold connectors during polishing. The process involves a multi-stage abrasive progression?from coarse to fine grits?to remove imperfections, scratches, and epoxy residue, ultimately yielding a mirror-like finish that meets industry standards for low insertion loss and high return loss. Advanced systems may incorporate automated features, real-time monitoring, and calibration tools to ensure consistency, repeatability, and compliance with specifications for applications in telecommunications, data centers, medical devices, and military/aerospace sectors.

The global Fibre Optic Polishing System market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
