Report Overview

Fibrin tissue adhesive is mainly composed of fibrinogen (containing coagulation factor XIII, fibronectin and appropriate aprotinin) and thrombin concentrate prepared from human plasma. When the two components are mixed, it simulates the end of the coagulation chain reaction. In one step, fibrinogen is gradually polymerized through the activation of fibrinogen by thrombin, and finally a fibrin solidified substance is formed, which plays a role of hemostasis and tissue adhesion before and after surgery.
