Report Overview

Field emission scanning electron microscope (FESEM) is an instrument that provides various information from the sample surface with high resolution and larger energy range. Used to visualize very small topographic details on a surface or whole or part of an object. It uses negatively charged electrons instead of light. These electrons are released by the field emission source. The electron scans the object according to the sawtooth pattern, and the detector captures the secondary electron and generates an electronic signal.

The global Field Emission Scanning Electron Microscopes(FE-SEM) market size was estimated at USD 789.60 million in 2023 and is projected to reach USD 1143.45 million by 2032, exhibiting a CAGR of 4.20% during the forecast period.
