Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Film for Semiconductor Packaging competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Packaging is a process of placing, fixing, sealing, and connecting chip contacts to the package shell through specific materials and process technologies. Its core role is to protect chip performance and extend internal functions to the outside. The basic packaging process covers key links such as wafer grinding, wafer cutting, die attach, and molding. After the semiconductor wafer is manufactured in the Fab plant, it needs to be reduced in thickness by back thinning (Back Grinding) according to the chip packaging size requirements before packaging; after thinning, it is cut (Dicing/Sawing) according to the die size (Die Size) to obtain the target size, and then enters the packaging stage after processes such as die picking and die bonding. As the grain size develops towards miniaturization, the packaging process has derived diversified technologies, and some links may require film assistance. This has led to the demand for film materials in different processes. These films are mainly used for surface protection or adhesion during packaging. Specific types include wafer grinding tape, Dicing tape, DAF film, wafer back side protection film, release film, PI film/tape, etc. This article focuses on the statistics of films/tapes used in traditional semiconductor packaging and advanced packaging processes.

The global Film for Semiconductor Packaging market size was estimated at USD 1950.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
