### Report Overview

Film capacitors for power factor correction are capacitors used to improve the power factor of power systems. It usually consists of metal electrodes and an insulating film, and is capable of storing electrical energy in an AC circuit to correct the power factor of the circuit. Power factor is the ratio of useful power to apparent power in a circuit. When there are inductive components in the circuit (such as motors, transformers, coils, etc.), the power factor of the circuit may be lower than 1, which will lead to inefficient circuits, increased energy consumption and shortened equipment life. Film capacitors for power factor correction can improve the power factor of the circuit, reduce the reactive power loss of the grid, and reduce the cost of electric energy. These capacitors are commonly used in large power systems, factories and commercial buildings. The advantages of film capacitors for power factor correction include strong energy storage capacity, stable capacity value, long service life, no pollution, small size, and light weight. At the same time, they are designed and manufactured to meet the needs of various power systems, such as working in special environments such as high voltage, high frequency, and high temperature.

The global Film Capacitors For Power Factor Correction market size was estimated at USD 594.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.15% during the forecast period.
