Abstracts

Film dielectric capacitors are a specialized class of passive electronic components characterized by a thin plastic film—such as polyester (PET), polypropylene (PP), polyphenylene sulfide (PPS), or polytetrafluoroethylene (PTFE)—serving as the dielectric material, which is either metallized or paired with metal foil electrodes to store and regulate electrical energy. These capacitors are distinguished by their stability, low dielectric losses, high insulation resistance, and self-healing properties in the case of metallized types, making them suitable for applications requiring precise capacitance values, minimal signal distortion, and reliable performance across a wide range of frequencies, temperatures, and voltages. They are commonly used in AC and power electronics, filtering, coupling, snubber circuits, motor run applications, lighting ballasts, and audio systems, where their combination of electrical characteristics, longevity, and safety features outperforms alternatives like ceramic or electrolytic capacitors in critical environments.

The global Film Dielectric Capacitor market size was estimated at USD 430.55 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
