Report Overview

A filter press is a solid-liquid separation device that uses the principle of pressure feeding. It has a series of filter plates arranged together and recessed plates or frames that are arranged in an alternative manner. The filter medium is arranged in between the filter press plates. A feeding pump is used for forcing liquid through a medium, thus leaving solids trapped inside. When compared with other pressure filters, the filter press holds a higher volume of solids per square foot of the filtering surface area. The closer which is required is hydraulically or manually operated. It contains a controller, which presses the filter plates together, thus creating a sealed unit. The hydraulic system, which is best suited for dewatering applications, is typically dependent on the size of the filter press required.

The recessed plate filter press segment accounts for the highest share of filter press market due to the growth of the pharmaceutical and polymer industry. Additionally, the rise in the sales of vehicles which will lead to more tires being used in new cars, will also increase the demand for recessed plate filter presses.
