Report Overview

A filtering funnel is a laboratory apparatus used for separating solids from liquids or for performing filtration processes. It consists of a conical-shaped glass or plastic funnel with a narrow stem at the bottom, which is connected to a receiving flask or container. The main purpose of a filtering funnel is to separate a solid-liquid mixture by passing it through a filter paper or other porous material. The solid particles are retained on the filter paper, while the liquid passes through and collects in the receiving flask below. Filtering funnels are commonly used in various scientific disciplines, such as chemistry, biology, and environmental science, for tasks like separating precipitates from solutions, purifying liquids, or isolating particulate matter from samples. They are essential tools in many laboratory settings where separation and purification of mixtures are required.
