Abstracts

?Fine classifier? is a device used to classify solid particles according to particle size, density, shape or surface physical and chemical characteristics. Its core principle is to use the difference in sedimentation velocity of particles in the medium to achieve classification. Specifically, the fine classifier divides the particle group into two or more particle size levels through the two key processes of dispersion and separation. Fine classifiers are mainly divided into two categories: dry classifiers, which use air as the medium, and mainly include turbine airflow classifiers. Wet fine classifiers, which use water or oil as the medium, mainly include ultrafine hydrocyclones and horizontal spiral decanter centrifuges.

The global Fine Classifier market size was estimated at USD 1337.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
