Report Overview

Fingerprint recognition is the earliest application of mobile phone biometrics, and it is currently the most extensive and mature field. At present, there are three main types of fingerprint recognition technologies commonly used in mobile phones: capacitive, optical, and ultrasonic. The principle of the sensor is to use the height of the fingerprint to form different capacitance values depending on the distance from the sensor. The fingerprint information can be obtained by measuring these capacitance values, and then the fingerprint information is converted into an electrical signal so that the mobile phone can recognize it. At present, most of the fingerprint recognition modules on our mobile phones are based on capacitive type.
