Abstracts

Fire retardant pressure treated lumber and plywood are wood products that have undergone a pressure treatment process to enhance their resistance to fire while maintaining the structural integrity and durability of the wood. During the treatment process, a fire-retardant chemical is forced into the wood under high pressure, making the material less likely to ignite and slowing down the spread of fire. These materials are commonly used in construction and building applications where fire safety is a concern, such as in commercial buildings, schools, and residential homes. The fire-retardant chemicals used in the treatment process vary, but they generally do not compromise the wood's ability to withstand moisture, rot, or insect damage.

The global Fire Retardant Pressure Treated Lumber and Plywood market size was estimated at USD 1020.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
