Abstracts

A fire tube steam boiler is a type of boiler in which hot gases produced by combustion pass through one or more tubes running through a sealed container of water, transferring heat to the water and generating steam. These boilers are characterized by their relatively simple construction, compact size, and ease of operation, making them suitable for a wide range of industrial and commercial applications where moderate steam pressures and capacities are required. Due to their design, fire tube boilers are typically more cost-effective to manufacture and maintain compared to water tube boilers, and they are commonly used in sectors such as food processing, chemical manufacturing, hospitals, and laundries, where reliable and efficient steam generation is essential for processes like heating, sterilization, and power generation.

The global Fire Tube Steam Boiler market size was estimated at USD 2450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
