Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Fischer-Tropsch Medium Waxes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Fischer-Tropsch Medium Waxes refer to the class of synthetic waxes derived from Fischer-Tropsch synthesis, in which the product fraction is comprised of linear saturated alkanes and has a melting point in the approximate range of 40-75 °C. These waxes feature highly regular molecular structure, very low impurity levels (sulfur, nitrogen and aromatics), low oil content and low melt viscosity. Typical grades include IW2F (58-63 °C), IW3F (60-65 °C) and SX70 (70-72 °C), and are supplied in liquid bulk, slab/pellet or powder form. Because their melting point is moderate and they are compatible with paraffin waxes, they are commonly used as substitutes for semi-refined paraffin waxes (SRPW) and as base waxes for general industrial formulations such as rubber protective waxes, textile and polishing agents, candle and paper coating waxes, and general adhesive and coating systems. On the catalyst/feedstock side they share the same Fischer-Tropsch route: iron-based catalysts, with water-gas shift (WGS) activity, suit coal or biomass syngas with lower H₂/CO ratio; cobalt-based catalysts, with low WGS activity but longer life, serve higher H₂/CO syngas (often natural gas) and tend to produce paraffins. Compared with high-melting Fischer-Tropsch hard waxes, medium-melting FT waxes because of their lower melting point and moderate hardness are more advantageous in formulations requiring good film formation, lubrication and compatibility with conventional paraffin waxes. In 2024, global production of Fischer-Tropsch medium wax reached 202,480 metric tons, with an average selling price of US \$1,137 per ton.
