Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Fish Bone Peptide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of fish bone peptides was 46,000 tons, with an average price of US\$7,450 per ton. Fish bone peptide refers to a bioactive peptide extracted and made from fish bones. It contains collagen, chondroitin, calcium, phosphorus, zinc and other nutrients that are beneficial to the human body. Fish bone peptide is usually used as a dietary supplement to supplement the nutrients needed by the body, especially calcium and collagen. The upstream of fish bone peptides mainly comes from fish bone by-products produced by marine fish processing enterprises, enzyme preparation suppliers, and food-grade antioxidant excipient suppliers. Upstream resources determine the cleanliness, calcium content, and collagen structure integrity of raw materials. Downstream sectors are concentrated in health food companies, functional food OEM manufacturers, sports nutrition companies, and beauty and anti-aging brands. Health food companies use fish bone peptides as a flagship product for calcium supplementation and improving bone metabolism; sports nutrition brands leverage its properties of promoting bone toughness and joint support; beauty and anti-aging brands emphasize its small-molecule collagen absorption advantage and combine it with vitamin C or hyaluronic acid to improve skin elasticity; and medical and elderly care institutions and special medical food companies are also beginning to use fish bone peptides for nutritional support for elderly people with osteoporosis and those recovering from surgery. Downstream demand is growing faster than upstream supply, and the market is clearly showing a structural upgrade from coarse powder and ordinary peptides to small-molecule high-purity peptides and specific targeted peptides. The industry's development is supported by policies promoting the high-value utilization of

marine by-products, in-depth research on the absorption mechanism of small-molecule peptides, breakthroughs in odorless decolorization technology, and the continuous increase in consumer preference for natural and efficient calcium supplements and anti-aging products. The driving factors mainly include increased penetration of nutritional supplements, a growing sports and fitness population, the promotion of marine peptide products by cross-border e-commerce, the trend towards additive-free clean formulas, and the aging population's strong demand for bone health. The hindering factors include the seasonal fluctuations in the supply of marine fish raw materials, the difficulty in controlling the flavor of small molecule peptides, inconsistent regulations on peptide components in some countries, and insufficient consumer awareness of the differences between fish bone peptides and collagen peptides, requiring companies to invest more in public education and clinical validation. A single production line has an annual output of approximately 200-500 tons, with a gross profit margin typically between 25% and 40%.

The global Fish Bone Peptide market size was estimated at USD 343.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
