Abstracts

Fish collagen hydrolysate is a hydrolyzed form of collagen derived from fish skin, scales, or bones, processed through enzymatic or chemical hydrolysis to break down collagen molecules into smaller peptides and amino acids with enhanced bioavailability, solubility, and absorption compared to native collagen. It is primarily used in nutraceutical, cosmetic, and pharmaceutical applications due to its functional properties, such as promoting skin elasticity, joint health, and bone density, while offering advantages over mammalian-sourced collagen, including reduced risk of disease transmission, suitability for pescatarian and halal/kosher diets, and alignment with sustainable sourcing practices by utilizing fish processing by-products.

The global Fish Collagen Hydrolysate market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
