Its core technology lies in the use of image recognition algorithms or hydrodynamic models, real-time processing of the data stream generated by the movement of fish, accurate distinction between the number of individuals, and at the same time has the ability to resist interference, can work stably in complex water quality environment. Some high-end devices also integrate water temperature and flow rate monitoring functions, which can synchronously record the parameters of the breeding environment during counting, providing data support for the scale management of aquaculture, the control of seedling placement density and the assessment of growth status, and are widely used in fish breeding bases, aquaculture farms and scientific research institutes in the scenario of fish resource counting. Fish fry and fish counters have gained prominence in the fishing industry. These devices are used to accurately count and measure fish caught during fishing operations. Fish counters help fishermen

and fisheries managers collect data on fish populations, which is crucial for sustainable fishing practices and conservation efforts. The use of fish counters has become more prevalent due to advancements in technology. Modern fish counters utilize various methods such as acoustic, optical, or mechanical sensors to accurately count fish. These devices can be installed on fishing vessels or in fishways, allowing for real-time data collection and analysis. The data collected by fish counters helps fisheries managers make informed decisions regarding fishing quotas, habitat restoration, and conservation efforts.
