## Abstracts

Fish waste management is a crucial aspect of the fishing and aquaculture industries, aiming to handle and dispose of fish waste in an environmentally sustainable and economically beneficial manner. When fish waste is not properly managed, it can lead to water pollution. Decomposition of waste in water bodies consumes oxygen, leading to oxygen - depleted zones that can harm aquatic life. Nutrients from the waste, such as nitrogen and phosphorus, can also cause eutrophication, resulting in algal blooms and further degradation of water quality. Valuable resources in fish waste, such as proteins, lipids, and minerals, are wasted. These could potentially be used in other industries, such as the production of animal feed, fertilizers, or bio - based products, representing an economic loss.

The global Fish Waste Management market size was estimated at USD 1826.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
